Performance Based Objectives – Industrial Electricity

PBO No.	Performance Based Objective
ET-1	Safely work with electricity and electrical components.
ET-36	Match a list of the kinds of personal protection equipment to their proper description.
ET-37	Identify the level of current that poses a serious life-threatening condition to the human body.
ET-2	Match a list of safety practices to the electrical hazards they prevent.
ET-3	Match a list of the fundamental ways of generating electricity with examples of each.
ET-4	Use scientific notation to represent mathematical quantities.
ET-5	Demonstrate the ability to represent a given quantity using the following prefixes: milli, micro, nano, pico, kilo, meg, giga, and tera.
ET-6	Match the following list of electrical terms to their proper definition: - Volt - Ampere - Ohm - Conductance - Resistance - Insulator - Resistor - Open - Short - Coulomb
ET-7	Match a list of fuses and circuit breakers to their proper descriptions.
ET-8	Match wire samples to a list of their proper size and description.
ET-9	List the factors that determine the current capacity of a wire conductor.
ET-10	Determine the resistance values of color banded Carbon resistors through the interpretation of the bands and verify their results through the use of a digital or an analog ohmmeter.
ET-11	Demonstrate proficiency in the use of the following test equipment: - Digital multi-meter - Analog multi-meter - Clamp-on meter - Meg-ohmmeter - Oscilloscope
ET-12	Given a 10VDC supply and a 10K ohm resistor, calculate the current flow in the circuit, construct, and verify with the use of an ammeter.
ET-13	Construct, and debug a series circuit containing 3 resistors and a 10VDC supply. Using Ohm's Law and Kirchhoff's Law, calculate the total current flowing in the circuit, the total resistance of the circuit, the voltage drop across each resistor, and the power requirement for each resistor. Then verify all calculations with the use of a multi-meter.
ET-14	Construct, and debug a parallel circuit containing 3 resistors and a 10VDC supply. Using Ohm's Law, Kirchhoff's Law, and the Parallel Resistance formula, calculate the total current flowing in the circuit, the total resistance of the circuit, the current flow through each resistor, and the power requirement for each resistor. Then verify all calculations with the use of a multi-meter.

Performance Based Objectives – Industrial Electricity

PBO No.	Performance Based Objective
ET-15	Given a circuit containing (3) series resistors and a 20VDC supply, determine what will happen to all voltages and currents and the total resistance if any one of the resistors is shorted or opened. Design, construct, and debug the circuit, and verify all calculations with a multi-meter.
ET-16	Match standardized symbols used in schematic diagrams to their proper electronic components.
ET-17	Using schematic diagrams construct and debug various electrical resistive circuits.
ET-18	Construct an electromagnet using a battery, a coil of wire, and a ferromagnetic core. Estimate and verify what will happen to the strength of magnetic field when the number of turns is increased and verify in lab.
ET-19	Demonstrate the induction method of generating a voltage using a coil of wire and a permanent magnet, then estimate and verify using a multi-meter or oscilloscope. What will happen if: - The number of turns is increased? - The strength of the magnet is increased?
ET-20	Given a graphical representation of an AC sine wave, calculate the Peak to Peak voltage, Peak voltage, RMS voltage, Average voltage, Period, and the Frequency, when some of the values are given.
ET-21	Setup the scope to take measurements from a starting condition of all adjustments fully counterclockwise, all switch positions in the center, left position if only a 2-position switch, and all pushbuttons out.
ET-22	Construct, and debug a circuit with 2 resistors in series and an AC source of 10 to 20VAC. Calculate the voltage drop across each resistor and verify with a multi-meter. Also, verify with an oscilloscope and compare the two measurements.
ET-23	Using the Reactance Formula, determine the Inductive Reactance of an Inductor in an electrical AC circuit.
ET-24	Using the Reactance Formula, determine the Capacitive Reactance of a Capacitor in an electrical AC circuit.
ET-25	Construct, and debug series and parallel Inductive AC circuits. Use an oscilloscope to measure and analyze the waveforms. Calculate all voltages, currents, powers, and phase angles for the circuit. Verify all voltage, current and phase angle calculations through the proper use of meters and scopes.
ET-26	Construct, and debug series and parallel Capacitive AC circuits. Use an oscilloscope to measure and analyze the waveforms. Calculate all voltages, currents, powers and phase angles for the circuit. Verify all voltage, current and phase angle calculations through the proper use of meters and scopes.
ET-27	Given values of inductors and resistors, calculate the LR time constant. Construct an inductive/resistive electrical circuit and verify results.
ET-28	Given values of capacitors and resistors, calculate the RC time constant. Construct a capacitive/resistive electrical circuit and verify results.

Performance Based Objectives – Industrial Electricity

PBO No.	Performance Based Objective
ET-29	Construct and debug a series/parallel electrical circuit. Apply Thevenin's theorem to simplify the circuit for analysis. Verify the results through practical substitution and measurement.
ET-30	Construct and debug series/parallel Inductive/Capacitive/Resistive AC circuits. Use an oscilloscope to measure and analyze the sinusoidal waveforms, calculate and then measure the voltage and current values of the sine waves. Measure the phase angle between the applied voltage and the total current.
ET-31	Use a continuity checker and an ohmmeter to verify the normally open and normally closed set of contacts on a switch.
ET-32	Using live electrical circuits, make voltage measurements with respect to ground.
ET-33	Use a voltmeter to determine the state of a switch (open or closed) in a circuit under power. Additionally, predict and verify with an ammeter whether current is flowing.
ET-34	Given a switch, a DC relay, DC power source, light bulb, and AC power source, determine the N/O contacts of the relay and construct a circuit where the DC switching circuit controls the AC power to the light bulb.
ET-35	Given a schematic, construct and debug an electrical circuit used for the purpose of troubleshooting. Demonstrate fault finding skills with the use of multi-meters to locate shorted and open circuits, induced by the Instructor.
ET-38	Match a list of terms for transformers to their proper description.
ET-39	Given primary voltage and current, use the known turns ratio to calculate the transformer's secondary terminal voltage and current.
ET-41	Match a list of the following tests performed on transformers to their proper description: - Polarity test - Insulation resistance test - Excitation and Power factor test - Impedance measurement - Winding resistance and short circuit test - Thermal test - Tap change - Frequency response - Loading, off loading
